# Phenytoin

Absorption is slow and erratic, with delayed peak concentrations up to 1-2 days post ingestion. Toxicity can produce ataxia with a risk of falls.

### **Toxicity / Risk Assessment**

- > 20 mg/kg: mild GI upset, CNS effects, esp. cerebellar
- > 100 mg/kg: coma and seizures

Phenytoin exhibits zero order elimination kinetics (this can lead to a prolonged half-life in overdose)

Rapid IV injection can cause bradycardia, hypotension, arrhythmias. These are due to propylene glycol diluent Accumulation and clinical toxicity is possible following dose changes and introduction of new medications

#### **Clinical features:**

Phenytoin concentrations correlate with toxicity:

- >20mg/L (80 μmol/L): nystagmus, GI symptoms
- 30-40mg/L (120-160  $\mu$ mol/L): ataxia, N+V, bradycardia hyperreflexia, dysarthria, drowsiness, ophthalmoplegia
- > 50 mg/L (>200  $\mu$ mol/L): cerebellar toxicity, coma, seizures

Hypernatremia

Cerebellar ataxia (may lead to significant falls risk)

# Management

Mainstay is supportive care. Serial phenytoin concentrations may guide further management.

#### **Decontamination:**

**Activated charcoal** (50 g in adults, 1 g/kg in children) should be offered to awake, cooperative patients within 4 hours following acute ingestion of >20mg/kg

**Multi-dose activated charcoal** may enhance elimination of phenytoin and should be considered in patients with severe clinical features (please discuss with clinical toxicologist)

Antidotes: Nil available.

Indications for Haemodialysis: Discuss with clinical toxicologist

Prolonged coma expected

Refractory seizures

Should NOT be solely based on suspected dose ingested or serum phenytoin concentration

## Disposition

- Patients can be medically discharged once ataxia and sedation resolve
- Observe at least 6 hours following acute ingestion.
- Patients with only ataxia/nystagmus can be observed on a ward
- Children with reported ingestion < 20 mg/kg and asymptomatic can be observed at home
- Do not drive or operate heavy machinery for at least 3 days post discharge.
